

## **DIGITAL STEPPER DRIVE FOR STEPPER MOTORS**

#### CONTROL MODES

- Profile Position-Velocity-Torque, Interpolated Position, Homing
- Camming, Gearing
- Indexer

COMMAND INTERFACE

- CANopen
- ASCII and discrete I/O
- Master encoder (Gearing/Camming)
- Stepper mode position commands: Digital: Pulse/Dir, CW/CCW, Quad A/B Analog: ±10V position
- Servo mode commands:
- Digital: Pulse/Dir, CW/CCW, Quad A/B PWM Velocity/Torque command Analog: ±10V Position/Velocity/Torque
- COMMUNICATIONS
  - CANopen
- RS-232

FEEDBACK

Incremental Encoders

- Digital quad A/B
- Panasonic Incremental A Format
- Aux. quad A/B encoder / encoder out
- Absolute Encoders
- EnDat, Absolute A

I/O DIGITAL

- 16 non-isolated, 8 isolated inputs,
- 5 isolated outputs, 2 non-isolated outputs

ANALOG

• 2 Reference Inputs, 12-bit

SAFE TORQUE OFF (STO)

- SIL 3, Category 3, PL d
- DIMENSIONS: IN [MM]
  - 6.78 x 4.70 x 1.99 [172.1 x 119.3 x 50.4] no heatsink
  - 6.78 x 4.70 x 3.14 [172.1 x 119.3 x 79.9] with heatsink

| Model      | Ip | Ic | Vdc |
|------------|----|----|-----|
| TP2-090-07 | 7  | 5  | 90  |
| TP2-090-10 | 10 | 10 | 90  |

Current ratings are for each axis

#### DESCRIPTION

Stepnet TP2 is a dual-axis, high-performance, DC powered drive for position and velocity control of stepper motors via CANopen. Using advanced FPGA technology, the TP2 provides a significant reduction in the cost per node in multi-axis CANopen systems.

Each of the two axes in the *TP2* operate as *CANopen* nodes under DSP-402 for motion control devices. Supported modes include: Profile Position/Velocity, Interpolated Position Mode (PVT), and Homing.

In microstepping mode stepper command pulses and master encoder for camming or gearing are supported. Servo mode allows  $\pm 10V$  analog Position/Velocity/Torque, and PWM Velocity/Torque control.

There are sixteen high-speed digital inputs, two low-speed inputs for motor temperature switches, and eight optically isolated inputs. Outputs include five opto-isolated SSR and two isolated brake outputs. All inputs and outputs have programmable functions.

An RS-232 serial port provides a connection to Copley's CME2 software for commissioning, firmware upgrading, and saving configurations to flash memory.

Drive power is transformer-isolated DC from regulated or unregulated power supplies. An AuxHV input is provided for "keep-alive" operation enabling the drive PWM outputs to be completely powered down without losing position information, or communications with the control system.

## **CANOPEN COMMUNICATIONS**

Based on the CAN V2.0b physical layer, a robust, two-wire communication bus originally designed for automotive use where low-cost and noise-immunity are essential, CANopen adds support for motion-control devices and command synchronization. The result is a highly effective combination

#### CANOPEN CONNECTIONS

ERR

Stepnet Plus uses the CAN physical layer signals CAN\_H, CAN\_L, and CAN\_GND for connection, and CANopen protocol for communication. Before installing the drive in a CAN

#### CANOPEN LEDS (ON RJ-45 CONNECTORS)

| Off         | No        | (N/A)     | Port Closed             |

#### CANopen DEVICE ID (NETWORK ADDRESS)

In a CANopen network, nodes are assigned Node-IDs 1~127. Node-ID 0 is reserved for the CAN bus master. In the TP2, the node address is provided by two 16-position rotary switches with hexadecimal encoding. These can set the address of the drive A-axis from 0x01~0x7E (1~126 decimal). The B-axis will have an address of the A-axis + 1. The chart shows the decimal values of the hex settings of each switch. In the TP2, this is provided by two 16-position rotary switches with hexadecimal encoding. These can set the Device ID of the drive from 0x00~0xFF (0~255 decimal). The chart shows the decimal values of the hex settings of each switch.

Example 1: Find the switch settings for decimal Device ID 107:

1) Find the highest number in the x10 column that is less than 107 and set x10 to the hex value in the same row: 96 < 107 and 112 > 107, so x10 = 96 = Hex 6

- 2) Subtract 96 from the desired Device ID to get the decimal value for the switch x1 and set it to the Hex value in the same row: x1 = (107 - 96) = 11 = Hex B
- Result: X10 = 6, X1 = B, Alias = 0x6B (107)

## **INDICATORS: DRIVE STATE**

Two bi-color LEDs give the state of the TP2 drive. Colors do not alternate, and can be solid ON or blinking. When multiple conditions occur, only the top-most condition will be displayed. When that condition is cleared the next one below will shown.

| 1) Red/Blinking<br>2) Red/Solid  | = Latching<br>= Transien<br>the conc   | fault. Operation will not resume until drive is Reset. t fault condition. Drive will resume operation when lition causing the fault is removed. | AM<br>DE                | P LEDS &              | L                          |

## **COMMUNICATIONS: RS-232 SERIAL**

*TP2* is configured via a three-wire, full-duplex DTE RS-232 port that operates from 9600 to 115,200 Baud, 8 bits, no parity, and one stop bit. Signal format is full-duplex, 3-wire, DTE using RxD, TxD, and Gnd. Connections to the *TP2* RS-232 port are through J4, an RJ-11 connector. The *TP2* Serial Cable Kit (SER-CK) contains a modular cable, and an adapter that connects to a 9-pin, Sub-D serial port connector (COM1, COM2, etc.) on PC's and compatibles.

SER-CK SERIAL CABLE KIT

The SER-CK provides connectivity between a D-Sub 9 male connector and the RJ-11 connector on the TP2. It includes an adapter that plugs into the COM1 (or other) port of a PC and uses common modular cable to connect to the TP2. The connections are shown in the diagram TP2ow.

#### J4: RS-232 PORT

After power-on, reset, or transmission of a Break character, the Baud rate will be 9,600. Once communication has been

established at this speed, the Baud rate can be changed to a higher rate (19,200, 57,600, 115,200).

RJ-11 receptacle, 6 position, 4 contact

Don't forget to order a Serial Cable Kit SER-CK when placing your order for a TP2!

USB TO RS-232 ADAPTERS

These may or may not have the speed to work at the 115,200 Baud rate which gives the best results with CME2. Users have reported that adapters using the FTDI chipset work well with CME2

### ASCII COMMUNICATIONS

The Copley ASCII Interface is a set of ASCII format commands that can be used to operate and monitor Copley Controls Stepnet, Stepnet, and TP2 series amplifiers over an RS-232 serial connection. For instance, after basic amplifier configuration values have been programmed using CME 2, a control program can use the ASCII Interface to:

- Enable the amplifier in Programmed Position mode.
- Home the axis.
- Issue a series of move commands while monitoring position, velocity, and other run-time variables.

The Baud rate defaults to 9,600 after power-on or reset and is programmable up to 115,200 thereafter. After power-on, reset, or transmission of a Break character, the Baud rate will be 9,600. Once communication has been established at this speed, the Baud rate can be changed to a higher rate (19,200, 57,600, 115,200). ASCII parameter 0x90 holds the Baud rate data. To set the rate to 115,200 enter this line from a terminal:

s r0x90 115200 <enter>

Then, change the Baud rate in the computer/controller to the new number and communicate at that rate.

Additional information can be found in the ASCII Programmers Guide on the Copley website: <a href="http://www.copleycontrols.com/Motion/pdf/ASCII\_ProgrammersGuide.pdf">http://www.copleycontrols.com/Motion/pdf/ASCII\_ProgrammersGuide.pdf</a>

## SAFE TORQUE OFF (STO)

The Safe Torque Off (STO) function is defined in IEC 61800-5-2. Two channels are provided which, when de-energized, prevent the upper and lower devices in the PWM outputs from being operated by the digital control core.

This provides a positive OFF capability that cannot be overridden by the control firmware, or associated hardware components. When the opto-couplers are energized (current is flowing in the input diodes), the control core will be able to control the on/off state of the PWM outputs.

### INSTALLATION

#### STO BYPASS (MUTING)

In order for the PWM outputs of the TP2 to be activated, current must be flowing through all of the opto-couplers that are connected to the STO-IN1 and STO-IN2 terminals of J6, and the drive must be in an ENABLED state. When the opto-couplers are OFF, the drive is in a Safe Torque Off (STO) state and the PWM outputs cannot be activated by the control core to drive a motor.

This diagram shows connections that will energize all of the optocouplers from an internal current-source. When this is done the STO feature is overridden and control of the output PWM stage is under control of the digital control core.

If not using the STO feature, these connections must be made in order for the TP2 to be enabled.

#### FUNCTIONAL DIAGRAM

Current must flow through all of the opto-couplers before the drive can be enabled

\* STO bypass connections on the TP2 and Xenus XEL-XPL models are different. If both drives are installed in the same cabinet, the diode should be wired as shown to prevent damage that could occur if the STO bypass connectors are installed on the wrong drive. The diode is not required for STO bypass on the TP2 and can be replaced by a wire between pins 7 and 9.

MULTI-MODE PORT AS AN INPUT

## **INPUT TYPES**

## POSITION COMMAND INPUTS: DIFFERENTIAL

- Pulse & Direction
- CW & CCW (Clockwise & Counter-Clockwise)
- Encoder Quad A & B

## CURRENT or VELOCITY COMMAND INPUTS: DIFFERENTIAL

- Current or Velocity & Direction
- Current or Velocity (+) & Current or Velocity (-)

## SECONDARY FEEDBACK: INCREMENTAL

Quad A/B/X incremental encoder

## SECONDARY FEEDBACK: ABSOLUTE

- S channel: Absolute A encoders (2-wire) The S channel first sends a Clock signal and then receives Data from the encoder in half-duplex mode.
- S & X channels: SSI, BiSS, EnDat encoders (4-wire) The X channel sends the Clock signal to the encoder, which initiates data transmission from the encoder on the S-channel in full-duplex mode

## ANALOG INPUTS: AIN1, AIN2

- ±10 Vdc, differential
- 12-bit resolution
- Programmable functions

The analog inputs have a  $\pm 10$  Vdc range at 12-bit resolution As reference inputs they can take position/velocity/torque commands from a controller. If not used as command inputs, they can be used as general-purpose analog inputs.

#### SPECIFICATIONS

| Spec             | Data | Notes   |
|------------------|------|---------|
| Input Voltage    | Vref | ±10 Vdc |

## FEEDBACK CONNECTIONS

### QUAD A/B/X INCREMENTAL ENCODER

Encoders with differential line-driver outputs are required (single-ended encoders are not supported) and provide incremental position feedback via the A/B signals and the optional index signal (X) gives a once per revolution position mark.

## A/B/X SIGNALS

| Signal | J7,J8 Pin     |  |
|--------|---------------|--|
| Enc A  | 13            |  |

Sgnd = Signal Ground F.G. = Frame Gnd

## QUAD ENCODER WITH INDEX

## **MULTI-PORT FEEDBACK CONNECTIONS**

#### **DUAL-LOOP FEEDBACK**

Incremental or absolute encoders can connect to the Multi-port to function as secondary feedback for dual-loop operation. Typically, the primary encoder (J7,J8) is mounted on the motor, and the secondary encoder (J1) mounts to the load. The primary encoder is used for velocity feedback and the secondary one us used for the actual load position. The graphic shows both incremental and absolute connections. Only one encoder per axis can connect to the multi-port for dual-loop opertion.

### **MULTI-PORT J1 SIGNALS**

| Signal | Axis A | Axis B |

| Sgnd   | 5, 16, 25, 26 |
| F.G.   | 1             |

Sgnd = Signal Ground F.G. = Frame Gnd

### **ABSOLUTE-A ENCODER**

The Absolute A interface is a serial, half-duplex type that is electrically the same as RS-485. Note the battery which must be connected. Without it, the encoder will produce a fault condition.

#### ABSOLUTE-A SIGNALS

| Signal | J7,J8 Pin     |
|--------|---------------|
| Data   | 15            |
| /Data  | 14            |
| +5V    | 6, 17         |
| Sgnd   | 5, 16, 25, 26 |
| F.G.   | 1             |

Sgnd = Signal Ground F.G. = Frame Gnd

## MOTOR CONNECTIONS

#### MOTOR PHASE CONNECTIONS

The drive outputs are three-phase PWM inverters that convert the DC buss voltage (+HV) into three sinusoidal voltage waveforms that drive the motor phase-coils. Cable should be sized for the continuous current rating of the motor. Motor cabling should use twisted, shielded conductors for CE compliance, and to minimize PWM noise coupling into other circuits. The motor cable shield should connect to motor frame and the drive frame ground terminal (J9,J10-1) for best results.

| MO. | TOR | SIGN | IALS |
|-----|-----|------|------|
|-----|-----|------|------|

| Signal    | J9,J10 Pin | + |
|-----------|------------|---|
| Mot A     | 5          |   |
| Mot /A    | 4          |   |
| Mot B     | 3          | 0 |
| Mot /B    | 2          |   |
| Frame Gnd | 1          |   |

#### **MOTOR OVER TEMP INPUT**

The 4.99k pull-up resistor works with PTC (positive temperature coefficient) thermistors that conform to BS 4999:Part 111:1987 (table TP2ow), or switches that open/close indicating a motor over-temperature condition. The active level is programmable. These inputs are programmable for other functions if not used as Motemp inputs. And, other inputs are programmable for the Motemp function.

#### **MOTEMP SIGNALS**

| Signal                 | Pin  |
|------------------------|------|
| Motemp A               | J7-7 |
| Motemp B               | J8-7 |
| J7,J8<br>Signal Ground | 5,10 |
| Frame Gnd              | 12   |

#### **BS 4999 SENSOR**

| Property  | Ohms   |
|---|--------|
| Resistance in the temperature range 20°C to +70°C | 60~750 |
| Resistance at 85°C                                | ≤1650  |
| Resistance at 95°C                                | ≥3990  |
| Resistance at 105°C                               | ≥12000 |

## MOTOR CONNECTIONS: ENCODER

The connections shown may not be used in all installations

### Stepnet Plus Panel 2-Axis

## NOTES:

 The +5VOut1 on J1-17,32 and J7-6, 17 is rated for 500 mA The +5VOut2 on J1-23,38 and J8-6, 17 is rated for 500 mA These are two independent power supplies, each with a 500 mA max output from all pins
 CE symbols indicate connections required for CE compliance.

## **DEVICE STRUCTURE & ISOLATION**

This graphic shows the electrical structure of the drive, detailing the elements that share a common circuit common (Signal Ground, HV Com) and circuits that are isolated and have no connection to internal circuits. Note that there is no connection between the heatplate (Chassis, Frame Ground) and any drive circuits.

## ntrols Stepnet Plus 2-Axis Panel CANopen

## **POWER & GROUNDING CONNECTIONS**

#### DC POWER CONNECTIONS

- DC power must be provided by transformers that are galvanically isolated and provide reinforced insulation from the mains. *Auto-transformers cannot be used*.
- The (-) terminal of the power supply is not grounded at the power supply. It is grounded near each drive.
- Cabling to multiple drives for the +HV and 0V is best done in a "star" configuration, and not a "daisy-chain".
- The 0V, or return terminal of the DC power should be connected to frame ground near the drive power connector. From that point, a short wire can connect to the drive HV Ground.
- Cabling to the drive +HV and 0V terminals must be sized to carry the expected continuous current of the drive in the user's
  installation.
- DC power cabling should be shielded, twisted-pair for best EMI reduction. The shield should connect to the power supply frame ground on one end, and to the drive frame ground on the other. Adding a pigtail and ring-lug, as short as possible will provide a good connection of the shield at the drive.
- Motor cabling typically includes a green/yellow conductor for protective bonding of the motor frame. Connect as shown in the Motor Connections diagram on the following page.
- Motor cable conductors should be twisted and shielded for best EMI suppression.
- If a green/yellow grounding wire connects the motor to the drive's PE terminal, the shield pigtail and ring-lug may connect to one
  of the screws that mount the drive to the panel. A P-clip to ground the shield as near as possible to the drive will increase the EMI
  suppression of the shield. On the motor-end, the shield frequently connects to the connector shell. If the motor cable is a flyinglead from the motor, the shield may be connected to the motor frame internally.
- Braided cable shields are more effective for EMI reduction than foil shields. Double-shielded cables typically have a braided outer shield and foil shields for the internal twisted pairs. This combination is effective for both EMI reduction and signal quality of the feedback signals from analog encoders.
- Motor cable shielding is not intended to be a protective bonding conductor unless otherwise specified by the motor manufacturer.
- In double-shielded cables, the internal shielding should connect to the drive's Signal Ground on one end, and should be
- unconnected on the motor end.
- Single-shield feedback cables connect to the drive frame on one end, and to the motor frame on the other. Depending on the construction of the motor, leaving the feedback cable shield disconnected on the motor but connected on the drive end may give better results.
- The drive should be secured to the equipment frame or panels using the mounting slots. This ensures a good electrical connection for optimal EMI performance. The drive chassis is electrically conductive.

#### DC POWER WIRING

P-clips secure cables to a panel and provide full contact to the cable shields after the insulation has been stripped. This should be done as close to the drive as possible for best EMI attenuation.

### +HV POWER SUPPLY REQUIREMENTS

**Regulated Power Supplies** 

- Must be over-voltage protected to 100 Vdc max when the STO (Safe Torque Off) feature of the drive is used.
- Require a diode and external capacitor to absorb regenerative energy.
- The VA rating should be greater than the actual continuous output power of the drives connected to the power supply, and adequate for the transient output power due to acceleration of motor loads.
- Must handle the internal capacitance of the drives on startup.

Unregulated Power Supplies

- No-load, high-line output voltage must not exceed 90 Vdc.
- Power supply internal capacitance adds to the drive's internal capacitance for absorption of regenerative energy.
- The VA (Volts & Amps) rating at the power supply's AC input is typically 30~40% greater than the total output power of the drives.

#### AUXILIARY HV POWER

- Aux HV is power that can keep the drive communications and feedback circuits active when the PWM output stage has been disabled by removing the main +HV supply.
- Useful during EMO (Emergency Off) conditions where the +HV supply must be removed from the drive and powered-down to ensure operator safety.
- Voltage range is the same as +HV.
- Powers the DC/DC converter that supplies operating voltages to the drive DSP and control circuits.
- Aux HV draws no current when the +HV voltage is greater than the Aux HV voltage.

#### MOTOR CONNECTIONS

- Motor cable shield connects to motor frame, is grounded with a P-clip near the drive and terminates in a ring-lug that is screwed to the drive chassis by a mounting screw to the panel
- If provided, a green/yellow grounding wire from the motor connects to the F.G. terminal of the motor connector.
- FEEDBACK CONNECTIONS
  - Cable shield connects to motor frame and to the F.G. terminal of the feedback connector.
  - When double-shielding is used, the inner shields connect to the Signal Ground at the drive, and is not connected at the motor end.
  - If not provided by the motor manufacturer, feedback cables rated for RS-422 communications are recommended for digital encoders.

#### REGENERATION

This chart shows the energy absorption in W·s for the drive operating at some typical DC voltages. It is based on the internal 470 uF capacitor and would be increased by the capacitance of the external DC power supply. When the load mechanical energy is greater than these values an external regenerative energy dissipater is required, or the DC power supply capacitance can be increased to absorb the regen energy.

## THERMALS: POWER DISSIPATION

The top chart on this page shows the internal power dissipation for one axis of the TP2 under differing power supply and output current conditions. The +HV values are for the average DC voltage of the drive power supply. The lower chart shows the temperature rise vs. power dissipation under differing mounting and cooling conditions.

## TOTAL POWER DISSIPATION

Use this chart to find the total power dissipation for both axes. Example:

Power supply HV = 65 Vdc Axis 1 current = 7.5 A, axis 2 = 9.0 A Total current = 16.5 A Total dissipation = 19 Watts

Total continuous output current of both axes

## THERMALS: MAXIMUM OPERATING TEMPERATURE VS. DISSIPATION

Use this chart to find the maximum operating temperature of the drive under differing mounting and cooling conditions. Example:

Using the 19 W value from the calculations above, draw a vertical line. This shows that 24 C is the maximum operating temperature for NHSNF, and that any of the other mounting/cooling options will be sufficient for operation up to the maximum ambient temperature of 45 C.

| HSF   | = | Heat Sink (with) Fan    |
|-------|---|-------------------------|
| NHSF  | = | No Heat Sink (with) Fan |
| HSNF  | = | Heat Sink No Fan        |
| NHSNF | = | No Heat Sink No Fan     |

## **THERMALS: MOUNTING & THERMAL RESISTANCE**

## MOUNTING

Thermal data for convection-cooling with a heatsink assumes a vertical mounting of the drive on a thermally non-conducting surface. Heatsink fins run parallel to the long axis of the drive. When fan-cooling is used vertical mounting is not necessary to guarantee thermal performance of the heatsink.

## THERMAL RESISTANCE

**TOP VIEWS VERTICAL MOUNTING** 

Thermal resistance is a measure of the temperature rise of the drive heatplate due to power dissipation in the drive. It is expressed in units of °C/W where the degrees are the temperature rise above ambient.

E.g., an drive dissipating 16 W mounted with no heatsink or fan would see a temperature rise of 38.2C above ambient based on the thermal resistance of 2.39C/W. Using the drive maximum heatplate temperature of 70C and subtracting 38.2C from that would give 31.7C as the maximum ambient temperature the drive in which the drive could operate before going into thermal shutdown. To operate at higher ambient temperatures a heatsink or forced-air would be required.

| NO HEATSINK, NO FAN | °C/W |
|---------------------|------|
| CONVECTION          | 2.32 |

| NO HEATSINK + FAN   | °C/W |
|---------------------|------|
| FORCED-AIR, 300 LFM | 0.98 |

| HEATSINK + FAN      | °C/W |
|---------------------|------|
| FORCED-AIR, 300 LFM | 0.61 |

## HEATSINK KIT INSTALLATION

- Standard heatsink for Stepnet Plus Panel TP2
- Complete kit for user installation of the heatsink

### DESCRIPTION

The TP2-HK is a kit containing a heatsink and mounting hardware for field installation of a standard heatsink onto a TP2 model stepper drive.

To order an TP2 drive with heatsink fitted at the factory, add "-H" to the model part number.

#### TP2-HK HEATSINK KIT PART LIST

| Qty | Description                 |                                  |  |
|-----|-----------------------------|----------------------------------|--|
| 1   | Heatsink, standard, TP2-HS  |                                  |  |
| 1   | Thermal material, 4x4 in.   |                                  |  |
|     | Kit, Heatsink Hardware, TP2 |                                  |  |
| 1   | 4                           | Washer, flat, #8                 |  |
|     | 4                           | Screw, PAN, SEMS, #8-32 x 1/2 in |  |

## INSTALLATION

- 1) Place the heatsink fins-down on a work surface. Orient the heatsink so that the edge with part number is away from you. The hole for the TP2 grounding lug should be to your left.
- Remove the clear protective film from the thermal material and discard it. Place the thermal material onto the heatsink in the placement area which is marked with four white "L".
  - Apply light pressure to ensure that the thermal material is flat.
- 3) Peel the white protective layer away from the thermal material. Do this slowly from one corner so as not to lift the thermal material from the heatsink.
- 4) Align the TP2 as shown and lower onto the heatsink. If needed to adjust the position, lift it away from the thermal material and lower onto the heatsink again.
- 5) Install the four mounting screws with flat washers and tighten evenly. Torque to 17.8 lb-in (2.0 Nm) maximum.

|           | 1   | J3         | Broko         | Plug, 5 position, 3.5 mm, female                                | Wago: 734-105/107-000 (Note 1) |  |
|           | 1   |            | DIAKE         | Strain relief, snap-on, 3.5 mm, 5 position, grey                | Wago: 734-605                  |  |
|           | 1   |            | Tool          | Tool, wire insertion & extraction, 734 series                   | Wago: 734-231                  |  |
| Connector | 1   |            |               | Connector, DB-9M, 9-position, standard, male                    | TE/AMP: 205204-4               |  |
| Kit       | 9   | J6         | Safety        | AMPLIMITE HD-20 Crimp-Snap contacts, 24-20AWG, AU flash         | TE/AMP: 66506-9                |  |
|           | 1   | Note 2     |               | Metal Backshell, DB-9, RoHS                                     | 3M: 3357-9209                  |  |
|           | 4   |            |               | Jumper, with pins crimped on both ends                          | Copley: 10-75177-01            |  |
|           | 1   | 11         | Control       | Connector, high-density DB-44M, 44 position, male, solder cup   | Norcomp: 180-044-103L001       |  |
|           | 1   |            |               | Metal Backshell, DB-25, RoHS                                    | 3M: 3357-9225                  |  |
|           | 1   | J2         | I/O           | Connector, high-density DB-26F, 26 position, female, solder cup | Norcomp: 180-026-203L001       |  |
|           | 2   | J7, J8     | Feed-<br>back | Connector, high-density DB-26M, 26 position, male, solder cup   | Norcomp: 180-026-103L001       |  |
|           | 3   | J2, J7, J8 |               | Metal Backshell, DB-15, RoHS                                    | 3M: 3357-9215                  |  |
| SER-CK    | 1   | J5         | RS-232        | Serial Cable Kit  |                                |  |
| TP2-NC-10 | 1   | J8         | 10            | Natural   | CAN network cable, 10 ft (3 m) |  |
| TP2-NC-01 | 1   |            | Network       | CAN network cable, 1 ft (0.3 m)                                 |                                |  |

Note 1: For RoHS compliance, append "/RN01-0000" to the Wago part numbers listed above

Note 2: Insertion/extraction tool for J6 contacts is AMP/Tyco 91067-2 (not included in TP2-CK)

#### 16-01444 Document Revision History

| Revision | Date           | Remarks  |
|----------|----------------|--|
| 00       | March 27, 2017 | Preliminary version  |
| 02       | April 19, 2017 | Initial released version   |
| 03       | July 10, 2019  | Removed references to encoder loss protection which is not supported |
|          |                |  |

Note: Specifications subject to change without notice
